

Statistical significance of the resolution change produced by the thallium stabilization

After second heater stabilization → After thallium stabilization | 5 channels

$$z = (R_{\text{before}} - R_{\text{after}}) / \sqrt{\sigma_{\text{before}}^2 + \sigma_{\text{after}}^2}$$
 | errors added in quadrature

● resolution improved ($z > 0$) ● resolution worsened ($z < 0$) ■ not significant at 95 % (Student t , $\nu \approx 46$)
