

Statistical significance of the resolution change produced by the thallium stabilization

After second heater stabilization → After thallium stabilization | 4 channels

$$z = (R_{\text{before}} - R_{\text{after}}) / \sqrt{\sigma_{\text{before}}^2 + \sigma_{\text{after}}^2}$$
 | errors added in quadrature

↑ **improvement**

↓ **worsening**

● resolution improved (z > 0)

● resolution worsened (z < 0)

■ not significant at 95 % (Student t, ν ≈ 49)
