

Statistical significance of the resolution change produced by the thallium stabilization

After second heater stabilization → After thallium stabilization | 12 channels

$$z = (R_{\text{before}} - R_{\text{after}}) / \sqrt{\sigma_{\text{before}}^2 + \sigma_{\text{after}}^2} \quad | \quad \text{errors added in quadrature}$$

● resolution improved ($z > 0$)

● resolution worsened ($z < 0$)

■ not significant at 95 % (Student t , $\nu \approx 53$)

○ compared against optimum filter amplitude
